The DNA encoding this sequence was isolated from the Bacillus
The DNA encoding this sequence was isolated from the Bacillus
The DNA encoding this sequence was isolated from the Bacillus
Thuringiensis strain kumamoteensis. Insects in the family Scarabaeidae
constitute a serious pest control problem, especially when destructive
larval stage insects infest high value turf found in golf courses.

The larvae are known as white grubs, or chafter grubs, and ornamentals. The larvae are known as white grubs, or chafter grubs, and cnameentals. The larvae and the U.S. populations of where they consume plant roots. In Burope and the U.S. populations of these larvae and adults have developed resistance to chemical
insecticides such as the organochlorines and DDT. These toxin sequences, and intact calls that are capable of expressing these proteins, can be used to control many peets of the family scarabaeidae, such as species of Cyclocephala, and Popillia. The toxins are active against larvae (present in soil) and against adults. (Updated on 16-OCT-2003 to standardise OS
field)

Specifically, the two-spotted spider mite (Tetranychus urticae) is controlled. (Updated on 25-MAR-2003 to

The toxin is a delta-endotoxin which has a mol. wt. of ca. 130 kD. It is useful for control of coleoptera larvae e.g. it is effective against Anomala cuprea but has little effect on Lepidoptera. The toxin can be used as B.t. spores or crystals, as opt. treated cells (B.t. or transformed microorganisms) or it is expressed by plants. (Updated on 25-MAR-2003 to correct PN field.) (Updated on 24-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              strain of Bacillus thuringiensis serovar japonensis - producing toxin

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ò
                                                                                                                                                                                                                                                                                                                     The present invention relates to a new pesticidal polypeptide. The invention is useful for impacting an insect pest by applying the the molecules of the invention to the environment of the insect pest by spraying, dusting, broadcasting, or seed coating, where the insect pest is selected from Colorado potato beetle, western corn rootworm or southern corn rootworm. The invention is also useful for increasing insect target range and for producing transgenic microorganisms and plants that express the pesticidal polypeptide. The invention is also useful for producing transformed plants and in transforming any organism to produce the pesticidal polypeptide of the invention. The present amino acid sequence represents a Bacillus thuringiensis wild-type Cry1218

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Š
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to a new pesticidal polypeptide. The invention is useful for impacting an insect pest by applying the the molecules of the invention to the environment of the insect pest by spraying, dusting, broadcasting, or seed coating, where the insect pest is selected from Colorado potato beetle, western corn rootworm or southern corn rootworm. The invention is also useful for increasing insect target range and for producing transgenic microorganisms and plants that express the pesticidal polypeptide. The invention is also useful for producing transformed plants and in transforming any organism to produce the pesticidal polypeptide of the invention. The present amino acid sequence represents a Bacillus thuringiensis wiid-type Cry1218 endotoxin protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  179
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     180

The DNA encoding this sequence was isolated from the Bacillus thuringiensis strain kumanotoensis. Insects in the family Scarabaeidae constitute a serious pest control problem, especially when destructive larval stage insects infest high value turf found in golf courses, is playing fields and lawns. The larvae of many species also attack grains, tuberous crops, and ornamentals. The larvae are known as white grubs, or chafer grubs, and can be found in decaying organic matter, or in the soil where they consume plant roots. In Burope and the U.S. populations of these larvae and adults have developed resistance to chemical insecticides such as the organochlorines and DDT. These toxin sequences, and intact cells that are capable of expressing these proteins, can be used to control many pests of the family scarabaeidae, such as species of Cyclocephala, and Popillia. The toxins are active against larvae (present in soil) and against adults. (Updated on 16-OCT-2003 to standardise OS

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ઠે
                                                                                                                                                                                                                                                                                                                              This is the amino acid sequence of a Cry9C (crystal) mutant protein which is toxic to an insect species. It is modified in the method of the invention in an attempt to improve its toxicity. The improved proteins are useful for producing transgenic plants and seeds in controlling insects feeding on a plant. The transgenic plants are also useful for producing more transgenic plants with similar characteristics, or for introducing the improved cry9C gene (including fragments) into the same plant variety or related plant species. The Cry9C protein can be obtained from cultured cells of the transgenic plants and used in insecticide compositions against lepidopteran insects, especially Ostrinia nubilalis, Heliothis virescens and Diatraea grandiosella. The cry9C gene can be expressed in combination with another insect control protein (e.g. Another B.thuringiensis derived crystal protein, especially Cry1Ab or Cry1B-type protein), and used to transform B.thuringiensis, which crystales other insecticidal toxins. Such strains are useful against a variety of insect pests, or insects where insect resistance development is prevented or delayed. (Note: this sequence is not given in the insection).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                9

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              台
                                                                                                                                                                                                                                                                                                                                                           This is the amino acid sequence of a Cry9C (crystal) mutant protein which is toxic to an insect species. It is modified in the method of the invention in an attempt to improve its toxicity. The improved proteins are useful for producing transgenic plants and seeds in controlling insects feeding on a plant. The transgenic plants are also useful for producing more transgenic plants with similar characteristics, or for introducing the improved cry9C gene (including fragments) into the same plant variety or related plant species. The Cry9C protein can be obtained from cultured cells of the transgenic plants and used in insecticide compositions against lepidopteran insects. especially Ostrinia mubilalis, Heliothis virescens and Distrace grandiosella. The cry9C gene can be expressed in combination with another insect control protein (e.g. Another B thuringiensis derived crystal protein, especially Cry1Ab or Cry1B-type protein), and used to transform B thuringiensis, which crystels produces other insecticidal toxins. Such strains are useful against a variety of insect pests, or insects where insect resistance development is specification, but is generated using the information provided by the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      14;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     180

New Bacillus thuringiensis Cry9C crystal proteins with improved toxicity - useful for producing transgenic plants in controlling pest insects, especially Ostrinia nubilalis, Heliothis virescens and Diatraea grandiosella.

Example; Page; 40pp; English.

This is the amino acid sequence of a Cry9C (crystal) mutant protein which is toxic to an insect species. It is modified in the method of the invention in an attempt to improve its toxicity. The improved proteins are useful for producing transgenic plants and seeds in controlling are useful for producing transgenic plants and seeds in controlling insects feeding on a plant. The transgenic plants are also useful for producing more transgenic plants with similar characteristics, or for introducing the improved cry9C gene (including fragments) into the same plant variety or related plant species. The Cry9C protein can be obtained from cultured colls of the transgenic plants and used in insecticide compositions against lepidopteran insects, especially Ostrinia nubilalis, Heliothis virescens and Diatraea grandiosella. The cry9C gene can be expressed in combination with another insect control protein (e.g. Another B thuringiensis derived crystal protein, especially Cry1Ab- or Cry1B-type protein), and used to transform B thuringiensis, which crystoprotein of insect pests, or insects where insect resistance development is specification, but is generated using the information provided by the inventors.)
